

Lab 6: Java & JUnit

Internationalization & Localization

1. The difference between internationalization and localization is the scope. Localization is adapting code for a specific region, while internationalization is developing code with the forethought of multiple languages and cultures.
2. Internationalization and Localization are both important because of the connectivity of our world. There is no telling who will use a program when it is in development, so developing for a large audience is important. By developing for only a single language, a developer “bottlenecks” their audience.
